Aranda Query Manager

Here you can access the different solutions to problems presented in the AQM functionalities.

names Datasources

Errors connecting to a data source

Error: No data source with the name exists _Connection

An error occurs when a report (dashboard/report) fails to connect to a data source with a specific name. The report requires adjusting the name of the data source that is referenced in its definition.

To adjust the name of the data source, use the following utility:

- ConnectionParametersTool.zip

⚑ **Note:** You need to have the file with extension **.repx** in case of a report or **.XML** if it's a board.

How to Use the ConnectionParametersTool

1. After downloading the file with .zip extension, unzip the files into a folder.

2. In the files folder, open a powershell window and run the following command:

```
./Aranda.AQM.ConfigureConnection.Tool.exe
```

3. Enter the path where the report is located.

> **Example:**
> Enter the report path
> C:\InformFullPath\InformName.xml

4. Enter the letter **and** to rename the data source.

> **Example:**
> Do you want to rename the connection: ASDK9? **Y/N**

5. Enter the name of an existing data source in Query Manager. For more information, see **How to create a data source**

> **Example:**
> Enter the new name of the connection
> Conection_ASMS
> The connection name was successfully changed

6. Finally, you can import the report into Query Manager and view the defined information.

⚑ **Note:** The process of importing reports (Reports and Dashboards) into Aranda Querey Manager is the same for both queries. For more information, please visit the **Report Creation and Editing**.
